

Thin Computing Pilot in a Box for Enterprise Desktop Virtualization

If you are faced with these challenges every business day:

- Escalating desktop-maintenance and support costs with limited control
- Rising security risks from viruses, malware, and data theft
- Increasing administration headaches for role-based application access
- Decreasing employee productivity due to excessive local troubleshooting and updates
- Growing costs to support remote locations or a distributed workforce
- Continuing resistance against giving up personal operating system and applications

The Answer is Wyse Enterprise Desktop Virtualization

Desktop Virtualization is no longer just a buzz word, it is a reality.

Wyse Enterprise Desktop Virtualization (EDV) delivers the simplicity of administration your IT staff needs plus the personal operating system and applications your employees desire.

Wyse EDV takes desktop virtualization to the next level by removing the local storage and resulting desktop maintenance costs. With thin computers on the desktop, everything can be centrally managed: from the virtual desktop server to the desktop systems themselves. Using a virtual desktop server-based infrastructure decreases employee's downtime since all trouble shooting, management, and control can be handled efficiently from a central location. A virtual server set up greatly reduces risk of viruses by allowing your IT experts to build the proper infrastructure to create a more secure environment.

Wyse EDV also overcomes the hesitation of giving up a personal operating system and applications, because all operating systems, such as Windows XP Professional or Vista, execute independently for each desktop. Since each desktop has its own dedicated virtual machine a user will maintain their personalized desktop and applications while not conflicting with other users.

The key is to take the extra step in a virtual environment. A complete desktop virtual solution features a desktop device that can leverage this architecture while maintaining the security and management levels you put in place.

Thin Computing Pilot in a Box for Enterprise Desktop Virtualization includes:

- **25 Wyse S10-VDI-Edition Thin Computers**
The Wyse S10-VDI Edition delivers all the security of a stateless device, with a built-in, self-updating operating system that can quickly find and connect with the virtual desktop in the server.
- **25 licenses for Wyse Device Manager**
Infrastructure management software
- **2 Days of Onsite Consulting**
 - System Engineer (SE) gathers pilot project requirements, expectations, verifying that all complementing hardware and software meet minimum requirements.*
 - SE develops a core thin-computing architecture and local connection broker support.
 - SE transfers knowledge and product education to up to 2 employees.
 - SE configures pilot so testing and verification can begin.

How It Works

Start with the Server

The first thing you need is a virtual desktop server and desktop virtualization solution. The Wyse EDV solution works at the desktop, offering a simple solution that dramatically improves IT staff productivity.

Desktop virtualization puts a thin layer of software between the server hardware and the operating system. This supports the management of multiple virtual machines within the server: each virtual machine with its own operating system and applications. Then the Wyse EDV solution assigns each thin computer its own virtual machine on the server.

Address the desktop

At the desktop, the Wyse thin computer works just like a standard PC. The Wyse S10-VDI Edition is connection-broker aware, so it automatically finds its virtual desktop on the server. Your Wyse thin computers are also centrally managed and accessible from anywhere on the network. The Wyse Thin OS-VDI Edition also delivers the utmost security and protection from viruses and malicious software because the software does not have a publicly exposed API that can be exploited by hackers.

The Solution is Thin Computing Pilot in a Box

The Thin Computing Pilot in a Box will allow you to take the first step to tackle the challenges you face on a daily basis at the desktop. Wyse will work with your team to deliver lasting results in a focused pilot environment. All you need are the minimum hardware and software specifications for your virtual environment, the pilot in a box, and two days to work with a system engineer to get started.

This solution will allow you to see immediate results and drive you to build the needed business case to move forward with a full deployment of Wyse Enterprise Virtualized Desktop environment.
